

BWC

Motion Without Limits®

DUALVEE

Motion Technology®

DualVee Motion Technology® helps manufacturers and automation solution providers solve motion guidance requirements for critical and harsh environments. Simple to install and maintain, the self-aligning track paired with the constant sweeping action of our linear guide bearings result in a robust motion system. This superior design, perfected over 40 years and used by more than 20,000 customers, results in less noise, longer life, and lower total cost of ownership.

BISHOPWISECARVER GROUP
A FAMILY OF SOLUTIONS

Located in the historic California steel town of Pittsburg, today's bustling 85,000 square-foot facility is a far cry from the humble Oakland machine shop where the company's founder got his start in the 1950s.

The **Bishop-Wisecarver Group** (BWG) is a WBENC certified woman-owned family of companies who operate within AS9100C and ISO 9001:2008 certifications to work with manufacturers to engineer, manufacture, and build linear and rotary motion solutions, custom complex assemblies, and optimal embedded intelligence systems. Through the integration of our mechanical, electrical, software, control and systems design engineering expertise, 62+ years of experience, and 20,000+ unique clients, we continue to provide a single point of service that results in custom designs, increased efficiencies, and accelerated time to market.

BWC

Bishop-Wisecarver Corporation helps manufacturers and automation solution providers engineer linear and rotary motion solutions. With 60+ years of engineering expertise and manufacturing best practices working with over 20,000 customers, we understand our customers' design and application requirements which enables us to develop unique solutions that typically ship within 2 to 3 weeks. Customers achieve 50% faster time to market, up to 50-75% lower maintenance and installed costs, product differentiation, and longer product life.

WRW

WRW Engineering helps companies integrate mechanical, electrical and software engineering to deliver custom mechatronic solutions. By understanding the interplay between these three disciplines, we design and develop optimal embedded intelligence systems such as automated flexible testing stations, smart products, and autonomous machines. Through this holistic approach, our customers realize higher production efficiencies, faster time to market, and increased revenues.

BDM

Black Diamond Manufacturing is a specialty contract manufacturer of complex electro-mechanical sub-assemblies providing a single source solution from prototype to full production resulting in lower overall cost. BDM is different from other manufacturers because we have the ability to scale from prototype work to full production, and the ability to manage the customer's supply chain and hold consignment inventory. With 60+ years of in-house manufacturing experiences and capabilities BDM provides solutions for custom sub-assemblies.

Introduction

Bishop-Wisecarver is recognized as the market leader for guide wheel technology. In 1967, Bud Wisecarver invented and patented **DualVee Motion Technology®** to provide a solution for harsh environment applications where existing technologies were ineffective. **DualVee** also proved excellent for long lengths, smooth motion, and low noise requirements.

More than 45 years later, our wide range of linear motion components and systems provide time proven, economical solutions for all types of application environments. From clean room to high debris, freezer to oven, Bishop-Wisecarver has the linear solution to fit your needs.

Design Benefits

- Double row angular contact ball-bearing arrangement for dynamic loading conditions
- Sealed, shielded, or seal/shield combination to protect against contamination such as dirt, dust, metal chips, wood chips, textile fiber, food, slurry and deionized water
- Smooth, low friction motion
- High accuracy and repeatability
- Exceptionally long travel lengths and easily butt-jointed
- Radial load capacity ratings up to 3215 lbf per bearing
- Innovative track design with integrated mounting shoulder allows for accurate positioning and mounting of vee ways
- Speeds up to 5.5 meters per second
- Acceleration up to 5 g's
- Temperature ranges from -70°C to 260°C
- Track can be mounted to a variety of base materials without the need for precision ground or machined surfaces
- Low noise
- Flexible mounting options
- Track with mounting shoulder allows for accurate positioning of vee ways

Application Example

This assembly depicts how **DualVee Motion Technology®** is used in a linear guide application.

The pneumatic cylinder can be reliably and accurately positioned anywhere along the guide wheel track for flexible workpiece clamping.

Cross-section of DualVee guide wheel

Bushings are used for mounting guide wheels

Track is utilized for durable linear guidance

Product Overview

Original DualVee Guide Wheels

- Double row angular contact ball bearings offer excellent load carrying capacity in all orientations
- Internal rolling elements are isolated from the environment and protected from external contaminants by shields and seals
- Six standard sizes to accommodate design envelope and load carrying requirements

DualVee Studded Wheels

- Guide wheel with threaded stud permanently swaged to the through bore provides simplified installation
- Low profile for compact applications
- Threaded studs with large threads allow for greater torque capacity
- Available for all versions of DualVee guide wheels

DualVee Track With Integrated Mounting Shoulder

- Thin cross-section makes track compliant, assuring optimal installed accuracy (straightness and flatness of travel) when mounted against a machined register
- Accomodate heavy roll moment loads with a pair of tracks mounted in a wide spacing
- Available in standard lengths with or without mounting holes
- Available induction hardened and polished, or "as formed" in a soft condition
- Single piece track lengths up to 20 feet hardened or 22 feet unhardened
- AISI 1045 carbon steel and 420 stainless steel from stock
- Custom plating options include black oxide, thin dense chrome, electroless nickel, or zinc

Lubricators

- Easy to install and available from stock
- Dispenses a thin film of oil along the vee way
- Lubrication increases load capacity and service life
- Stainless steel lubricator housings with mounting hardware
- Lubricant and felt replacements available upon request

Bushings

- Designed for a fastener to pass through the bushing and the guide wheel, locking the elements into place against a mounting surface
- Concentric version with round flange for accurately aligning wheels to the fastener or mounting hole
- Eccentric version with hex flange allows for fit up and preload adjustments to guide track
- Standard and low profile head height configurations are available, providing flexibility in wheel height position
- Made from AISI 303 stainless steel

Journals

- Allows for fit up adjustments from the opposite side of the mounting surface for designs where access to the guide wheel is prohibitive
- Incorporate bushing and fastener into a single element with washers and nuts included
- Reduces the overall number of components per guide wheel
- Concentric and eccentric configurations available
- Made from AISI 303 stainless steel

Wheel Covers

- Available in kits that include the polymer cover housing, a vial of oil, felt inserts, and appropriate mounting hardware
- Sweeps away debris and dispenses a thin film of oil along the track vee way surfaces
- Maximizes service life, load capacity, and linear velocity
- Minimizes coefficient of friction, corrosion, and wear
- Satisfy safety requirements for elimination of possible pinch points by covering the rolling element and contact surface

Working Load Capacities

Working load capacities are based on empirical data on guide wheels used in general applications with static and dynamic load conditions. Guide wheels can routinely achieve travel life of one million cycles or higher when these specified load capacities are observed.

See product pages for specific load ratings

Bushing material is AISI 303 stainless steel

Preloading Instructions

Figure 1

Figure 2

Figure 3

Preloading a **DualVee®** guide wheel requires only a few simple tools:

- For **DualVee®** guide wheels with swaged studs, an open end wrench and a socket wrench are required.
- For **DualVee®** guide wheels with separate bushings and fasteners, two open end wrenches are required.

Although there are slightly different tools required for each type of **DualVee®** guide wheel, the process is the same for all of them

Step 1: Begin by placing the carriage on the track assembly with the concentric wheels fully tightened and the eccentric wheels finger-tightened within their mounting holes. Using one hand, insert the open end wrench between the eccentric wheel and the mounting plate to engage the hex flats of the bushing or stud on the wheel. Use the other hand to hold the open end wrench or socket wrench on the wheel's fastener (see Figures 1 and 2).

Step 2: Use the wrench to slowly turn the hex clockwise until resistance is felt—this indicates that the wheel is contacting the track. Then, with the wrench still held in position with one hand, tighten the eccentric wheel's fastener to lock the wheel into the adjusted position. This clockwise assembly orientation reduces the likelihood of the wheel loosening and moving out of its adjusted position because any subsequent radial load

between the wheel and track will cause a clockwise, self-tightening torque to develop on the wheel fastener.

Step 3: To check the level of preload, hold the carriage in place with one hand and rotate the wheel with the index finger and thumb of the other hand; the wheel's running surfaces should be able to slide on the track when the wheel is rotated with moderate hand turning effort (see Figure 3). If the wheel cannot be rotated, adjust the wrench position to reduce the preload and try again.

Step 4: Manually slide the carriage along the entire length of the system to determine whether there are any noticeable variations in rolling resistance. If there are, readjust the eccentric wheel as necessary. If the variation is unacceptably large, the tracks are likely not parallel enough and will need to be realigned.

DualVee guide wheels have substantial load carrying capacities and will become more smooth under load. Use the palm of your hand to apply downward pressure on the adjusted carriage when sliding along the track.

Step 5: If there is more than one eccentric wheel on the carriage, repeat Steps 2 through 4 with all of the other eccentric wheels. Once all wheels are adjusted, recheck all wheels, concentric and eccentric, for preload using the stationary carriage wheel rotation and sliding resistance methods described above, and readjust if necessary.

Mounting Dimensions/Formulas

When fabricating a **DualVee®** linear guide from components the following formulas are applicable for mating wheel plate and track plate designs

Size 0

- For size 0 double-edge track using size 0 guide wheels: **A** = 0.984 (25.0mm) (see Figure 1)

Size 1-4XL

For sizes 1 through 4XL **DualVee®** single-edge track with equivalent sized guide wheels:

- Inboard mounting (see Figure 2): **A = B + X**
- Outboard mounting (see Figure 3): **A = C - X**
- Exterior mounting (see Figure 4): **A = D - Y**

A = hole centers for wheel plate

Mounting Constraints

DUALVEE WHEEL SIZE	X		Y	
	(inches)	(mm)	(inches)	(mm)
1	.874	22.20	.934	23.72
2	1.374	34.90	1.436	36.47
3	2.000	50.80	2.124	53.95
4	2.624	66.60	2.750	69.85
4XL	3.124	79.35	3.500	88.90

Figure 2: Inboard Mounting

Figure 3: Outboard Mounting

Figure 4: Exterior Mounting

- Information above uses the same size DualVee track and wheel except for size 4XL which uses W4XL guide wheel with size T4 track.
- Side views shown only, length of wheel plates can be any length required.
- It is recommended that wheel plates be constructed with concentric bushings on one side of the plate and eccentric bushings on the opposing side.
- "D" dimension is to the theoretical sharp of the 90° angle.

Load/Life Relationship

For Common Weight-Bearing Scenarios

How long will your linear guide last?

Several factors influence the life of a **DualVee®** linear guide, and thus, **Bishop-Wisecarver** has devised a simple method to estimate the load/life relationship for a specific **DualVee®** guide mechanism under defined loading conditions. The methodology accounts for the size of the **DualVee®** bearing elements, relative spacing, and the orientation, location, and magnitude of the load. The equation is based upon clean and well lubricated track conditions. For applications where lubrication is prohibitive, a derating factor must be applied.

LOAD PER WHEEL
 Because wheel plates use 4 wheels, 2 wheels absorb the load at both points 1 and 2. Divide the calculated load by 2 to obtain the load on each wheel.

Step 1: Calculate the loads on each bearing in the system

Calculate the resultant radial and axial loads reflected to each bearing element in the linear guide design. All standard considerations involved in statics calculations must be accounted for: inertial forces, gravitational forces, external forces such as tool pressure, bearing element spacing, and magnitude and direction of the payload. Any external forces that generate a reaction through the wheel/track interface need to be accounted for.

Assumptions: Scenario 3

- F** = 200 lbs
- x** = 15 inches
- y** = 5 inches
- $F_{A1} = \frac{200(15)}{5} = 600 \text{ lbs, or } 300 \text{ lbs per wheel}$
- $F_{A2} = \frac{-200(15)}{5} = -600 \text{ lbs, or } -300 \text{ lbs per wheel}$
- $F_{R1} = 200 \text{ lbs, or } 100 \text{ lbs per wheel}$

Scenario 1

F_A = Resultant axial force	F_R = Resultant Radial force
$F_{A1} = \frac{F(x-a)}{x}$	F = Applied Force
$F_{A2} = \frac{Fa}{x}$	a = Distance from force to wheel
	x = Track vee apex spacing distance

Scenario 2

F_A = Resultant axial force	F_R = Resultant Radial force
$F_{A1} = \frac{F(x+a)}{x}$	F = Applied force
$F_{A2} = \frac{-Fa}{x}$	a = Distance from track vee apex to force
	x = Track vee apex spacing distance

Scenario 3

F_A = Resultant axial force	F_R = Resultant Radial force
$F_{A1} = \frac{Fx}{y}$	
$F_{A2} = \frac{-Fx}{y}$	
$F_{R1} = F$	

Load/Life Relationship

Step 2: Calculate the load factor L_F for the most heavily loaded bearing

As an example, let us use size W4X guide wheel $F_{A(max)}$ and $F_{R(max)}$ from the chart below)

F_A = Resultant axial load on the guide wheel

$F_{A(max)}$ = The maximum axial working load capacity of the guide wheel

F_R = Resultant radial load on the guide wheel

$F_{R(max)}$ = The maximum radial working load capacity of the guide wheel

$$L_F = \frac{F_A}{F_{A(max)}} + \frac{F_R}{F_{R(max)}} = \frac{300}{900} + \frac{100}{2181} = 0.38$$

LOAD CAPACITIES	DUALVEE WHEEL SIZE	WORKING RADIAL LOAD CAPACITY L_R		WORKING AXIAL LOAD CAPACITY L_A	
		N	lbf	N	lbf
		0	650	146	123
1	1220	274	252	57	
2	2650	596	625	141	
3	5900	1326	1701	382	
4	9700	2181	4001	900	
4XL	14300	3215	6552	1473	

- The most heavily loaded bearing will have the highest load factor
- Bearings should be sized such that $L_F \leq 1$

Step 3: Calculate life estimate by applying the load factor L_F to the load/life equation

Varying application load/speed parameters and environmental conditions require that the appropriate adjustment factor be applied to the life equation.

Adjustment Factor (A_F)

Application conditions include: contamination, duty, speed, cycle, acceleration, shock, presence of lubrication

DUALVEE WHEEL SIZE	LIFE CONSTANT L_c	
	INCHES OF TRAVEL LIFE	KILOMETERS OF TRAVEL LIFE
0	1.65×10^6	41
1	2.19×10^6	55
2	3.47×10^6	87
3	5.19×10^6	130
4	6.84×10^6	171
4XL	8.58×10^6	215

$$\text{Life} = \left(\frac{L_c}{(L_F)^3} \right) A_F$$

WHERE L_F = Load factor
 L_c = Life constant
 A_F = Adjustment factor

$$\text{Life} = \frac{6.84 \times 10^6}{(0.38)^3} \times 1.0 = 124.7 \times 10^6 \text{ inches}$$

Technical Reference

As a matter of good engineering practice the DualVee components should not be used where their wear or failure could cause personal injury.

Track Mounting

In most DualVee applications, accuracy plays a small role in the successful implementation of a guide wheel system. The flatness, straightness, and parallelism of the plate or bar to which the DualVee track is attached (bolted) determine the accuracy of the system. Cold finished or extruded bar or plate is adequate for many applications. The DualVee track incorporates a mounting shoulder to locate the track on the bar or plate.

Greater accuracy can be obtained by using a plate or bar that has been ground flat and parallel on the mounting surfaces. To achieve straightness and flatness characteristics to within N grade accuracy levels is fairly routine ($\pm .004$ inch; $\pm .10$ mm). In fact, accuracies as high as $\pm .001$ inch (.03 mm) can be achieved using carefully prepared mounting surfaces in relatively short stroke applications (1-3 feet; 0.3-1 m). For designs requiring accuracy levels of $\pm .005$ inch and better, mounting surfaces must be prepared straight and flat, and appropriate doweling or reference edge assembly techniques should be employed.

Track life – Hardened / Unhardened Track

For maximum loading and heavy continuous use, the “T” series hard edge track should be used. For prototype or light duty intermittent use, the “TS” series unhardened track can be used at a lower cost. Hardened track is surface hardened and polished on the vee surfaces and can be easily drilled or machined in the soft shoulder area.

Track Splicing Considerations for Long Travel Lengths

Precut lengths of track are not suitable for butting end to end. Please contact an Applications Engineer when track lengths longer than the maximum available single piece lengths are required. Track that is suitable for butting is available upon request. When constructing track systems longer than 20 feet, the joints on parallel tracks should be staggered for greater accuracy and smoothness.

Harsh/Debris-Laden Environments and Wear Resistance

Since the circumference of the wheel is greater at the major diameter than at the minor diameter, each rotation creates a variation of velocity on the surface of the wheel. This wheel surface velocity variation results in a constant sweeping action. As such, DualVee guide wheels are successfully employed in a wide variety of harsh environments, including in the presence of metal chips, powders, fibers, slurries, and other environments. The presence of harsh contaminants will reduce the service life of all types of linear guides. However, the DualVee guide wheel will drastically exceed the service life of competing technologies in harsh, debris-laden environments.

The other main factor affecting wear resistance is lubrication. Wheel covers or lubricators should be designed in whenever possible. Both will distribute a thin coating of oil lubricant along the contact surface of the DualVee track. The wheel cover offers added protection by preventing debris from entering the wheel/track contact surface. Lubricated and relatively clean wheel/track contact surfaces will ensure maximum service life in the DualVee linear guide.

As the hardness of the contaminants approaches the hardness of the track and wheels, the wear rate will increase. For these cases, an adjustment factor should be applied to maximum axial and radial working load capacities to provide a longer operating life.

Lubrication

Lubrication is the key to maximizing the life of DualVee linear guide products. Internally, DualVee guide wheels are lubricated for life with an extreme pressure, corrosion resistant grease. The lubrication of the wheel/track interface is the responsibility of the user.

Lubrication of the guide ways will maximize the load capacity of the system and will significantly increase the service life over a non-lubricated configuration under the same loads. A light machine oil, extreme pressure grease, vegetable oil, or dry lubricant will minimize wear, reduce the friction coefficient and associated stick slip, and inhibit corrosion on the guide ways of a DualVee-based design.

Lubrication will also increase the maximum linear velocity that a DualVee bearing arrangement can endure. In

applications where high speed or high acceleration rates are present, lubrication of the wheel/track interface is highly recommended. Lastly, lubrication will reduce the overall coefficient of friction of the guide, which, depending on the level of preload, can fall anywhere from 0.008 to 0.015. The availability of lubricators and wheel covers gives design engineers an opportunity to design lubrication right into the DualVee mechanism with little effort. See specifications on wheel covers and lubricators for more details.

Wheel Carriage Configurations

In designing a wheel carriage, it is important to use the right combination of eccentric and concentric guide wheels. Linear guide systems should always have two concentric wheels and all the other guide wheels should be eccentric. The eccentric wheels are adjusted to remove the play between the wheels and track, equally loading all the wheels so they roll instead of sliding or skipping on the track. When the wheel carriage is loaded in the radial direction, the pair of concentric wheels should carry the primary load.

It is important to note the location of the eccentric wheel is dependent on whether the track guide way is on the outside or inside of the wheel carriage.

Common Carriage Configurations

Below are several wheel carriage configurations. Typically, you have a 3 or 4 wheel carriage though you can have additional wheels by adding additional eccentric guide wheels.

Diagram Symbols:

- = Concentric guide wheel
- = Eccentric guide wheel
- ▼ = Radial loading direction

3 Wheel Carriage

4 Wheel Carriage

6 Wheel Carriage

Wheel Preload

Generally, wheel preload is used to eliminate play between the wheel and track. Preload equals the radial load when the system is not loaded by another outside force. Preload can be determined by:

$$\text{Preload} = \left(\frac{\text{BF}}{\text{CoF}} \right) - \text{AL}$$

WHERE:

- BF** = Breakaway Force
- CoF** = Coefficient of Friction
- AL** = Applied Radial Load

Caution must be used when applying preload because too much preload on the wheels can cause undue stress and can lead to premature failure. The rated radial value should never be exceeded by the preload and subsequent radial loads applied to the wheel when in service. Note that in a four guide wheel assembly sustaining a load that runs along a linear beam, preload on the wheels cannot compensate for deflection on the beam.

Typically, in a guide wheel and carriage application, there should be two concentric mounted wheels and the rest of the wheels should be on eccentric mounts. The eccentric type guide wheels are used to create a cam action to preload the guide wheels against one side of the guide track.

Normal adjustment is obtained by rotating the eccentric bushing, journal, or stud feature until all free play is removed from the carriage assembly. When the eccentrics are adjusted and the carriage plate is held firmly in place, one should be able to rotate by hand any one of the four guide wheels against the mating track. If rotation is not possible the preload should be reduced accordingly.

Studded Wheel Mounting

Suggested machining for mounting studded wheels (SWS series and SWI polymer) is shown below:

ECCENTRIC STUD

WHAT MAKES US DIFFERENT

Our engineering and manufacturing facility provides expert development support and quick turnaround time. We tackle all engineering challenges with a novel approach — we have the patents to prove it and are majority sourced USA. We offer custom engineering services and technical expertise in motion, sensor and actuator integration, real-time software development, and electromechanical modeling and design.

INDUSTRIES SERVED
